

ABSTRACT

2 The instant invention is directed towards an intra-
3 operative method and kit for essentially eliminating pain
4 associated with and resulting from surgical procedures,
5 comprising the administration of a medical solution including
6 a mixture of an injectable anesthetic, epinephrine, sodium
7 chloride and an injectable anti-inflammatory agent to a
8 plurality of sites within a surgical field utilizing a means
9 for administration which, in a contemplated embodiment, may
10 include a hollow shaft having a proximal end and a distal
11 end, wherein upon administration, said medical solution flows
12 within said shaft from said proximal end toward said distal
13 end, which distal end is defined by a solid end having a
14 plurality of circumferentially positioned apertures in said
15 shaft for providing radially directed flow of the medicated
16 solution circumferentially about said shaft.
